This project helps me to understand how Unix Shell works, I learned a lot about shell process and system calls. My biggest trouble is to understand how fork() works and how child generates, this was driving me crazy. By finishing this project, I had a better understanding of how wait and kill works in process level. Basically, this project takes user input s sting and check to see if they match with one of the buildin comments and do the corresponding order.

By the way, one of the most confusing part is how arguments working as parameter in main function but anyway this is a fun project.
